## Vitamix stopped working while blending

You have just gotten home after a long day at work and you are ready to prepare your dinner. You make all your favorite recipes in the Vitamix, but this time it is not working as well as usual. Your blender shuts off before you even reach full speed! Vitamix blenders are powered by a 2-peak horsepower, 120-volt motor that provides enough power to pulverize anything you can throw into it. Due to the high torque of this motor, there may be situations where it stalls or shuts off completely while blending. This article will explain some potential causes for your Vitamix blender shutting off and steps you can take to resolve the issue if it should occur again in future use. 1. Vitamix has a thermal overload protection system that will shut off the motor if it is overloaded for an extended period of time. 2. If you are blending something too thick, such as peanut butter or hummus without adding water. 3. If your machine shuts off while blending and won't turn back on after unplugging and re-plugging in the power cord, check the lid switch located near the bottom of the container. 4. The lid may not be properly engaged with the container's blade assembly; try pressing down on top of the lid until you hear a click sound. How Does The Vitamix Motor Work? The more the motor works (e.g., at a higher speed), the hotter it gets. This is because it draws more electricity when working hard, which in turn causes heat. A thicker blend just means that the motor has to work harder and so, therefore, will start to get hotter. Thicker blends slow down Vitamix's motors – this is why you see less of a blended texture when using them! The thickness slows down how quickly the blades can cut through and mix ingredients together and also increases friction between them as they rub on their own edges (i.e., like dragging your feet in the sand). Factors That Lead To Overheating Of The Motor 1. The Vitamix motor is designed to run at a certain RPM, and if it's running too hot or for too long, the motor may overheat 2. If your Vitamix has been operating at high speed for an extended period of time without any cool-down periods in between, there's a chance that the motor will overheat 3. A common cause of this is when you're blending something very thick like ice cream or frozen yogurt; try using the variable speeds to avoid overheating the motor. 4. Another reason why your Vitamix might be overheating: You've been using it with low water levels which can cause heat buildup inside the container and lead to burning out the heating element in some models. How To Prevent Overheating Of The Motor If you're blending hummus, nut butter, or ice cream, it's important not to blend more than four cups at a time. When doing this, always run the blender at maximum speed. To ensure the Vitamix doesn't overheat, use a fan or hair dryer to blow air into the vents. You can also cool it down faster by putting the base in the fridge for 20 minutes. If you leave it in too long, there may be condensation when removing it from refrigeration which could cause water spots on your machine's surface. My Vitamix Shut Off - What To Do Now? 1. Check to see if the Vitamix is plugged in. 2. Make sure the lid is on correctly and that it's not jammed. 3. Turn off the power and unplug for a few seconds, then plug back in. 4. If you're using frozen ingredients, make sure they are thawed before blending them with liquid. 5. Try pressing start again. Related Post: How To Remove Vitamix Blade Without Special Tool Conclusion If your Vitamix blender stalls or shuts off while blending, it may be due to the high torque of this motor. This is normal and does not indicate a problem with your machine. The stall can happen when you add ingredients that are too thick, such as frozen fruit or ice cubes. It can also occur if you try to blend at too low a speed for the amount of material in the container (for example, trying to make hot soup in a narrow container). To prevent stalling or shutting off completely during use, we recommend adding liquids first before adding thicker ingredients like frozen fruit and ice cubes. Also, experiment with different speeds until you find one that works best for each recipe. Related Posts Check Your Speed The Vitamix machine performs best on high speed to pulverise food and process thick mixtures. Check Your Quantity Processing cooked potatoes, cooked rice or cooked beans creates a heavier than normal load on the machine. You may want to consider reducing the food quantity placed in the container by half (depending on how much food you started with) and possibly adding a bit of liquid. Follow Order of Ingredients When following Vitamix recipes, be sure to place ingredients into the container in the order listed. If using your own recipe, follow this order for full-size containers: liquid ingredients first (water, juice, yoghurt), followed by softer ingredients (tofu), then juicier fruits and vegetables (grapes, cucumbers), firmer fruits and vegetables (apples, carrots), frozen ingredients (frozen berries), and finally ice. Dry ingredients like protein powders should follow the ice. Use the Tamper If ingredients are not freely circulating, the tamper can be used to improve the flow of food. While the machine is running and with the lid firmly in place, insert the tamper through the lid plug opening and hold it in one of the corners of the container. As the food travels around the side of the container, the tamper directs it right into the blades. If there is an air pocket around the blade, the tamper will release the air pocket and create a continuous flow of food through the blades. Yes, it is normal for this to happen as the coupling is aligning with the drive socket. Although all motors are tested at the Vitamix® factory, heavy use will cause further curing of the motor windings. This curing gives off a burning smell and is typical for wound motors. This smell will quickly dissipate after a few heavy uses. In addition, the Vitamix motor is designed to protect itself from overheating. If the motor should overheat, it may emit a burning smell. Turn the power switch off for up to 45 minutes, allowing the machine to cool down or reset. Reset time will be extended if high room temperatures exist. To reduce the reset time, unplug the machine, remove the container, and blow air into the center section of the bottom of the base with a hair dryer on the cool setting. The machine stopped because its thermal protector sensed that the machine was about to overheat. Turn the power switch off for up to 45 minutes, allowing the machine to cool down or reset. Reset time will be extended if high room temperatures exist. To reduce the reset time, unplug the machine, remove the container, and blow air into the center section of the bottom of the base with a hair dryer on the cool setting. If you are still unable to start your machine, please contact Customer Service. The S30 contains a Safety Interlock System that won't allow the machine to run if it senses that the container is not properly attached to the motor base. See instructions for how to properly align the container with the motor base. Either 1) the container was lifted or rocked from the motor base during blending and can quickly be reset or 2) the motor has overheated. Turn the dial to the Stop (○) position and allow the motor to cool for about an hour. Follow these S30 blending tips to avoid overheating the motor in the future. Place a plastic or wooden spatula handle in the notches of the blade base and turn the spatula counterclockwise to loosen the blade base from the container. Watch this technique If you notice your motor is no longer turning the blades, you should unplug the machine, remove the container from the motor base, and look at the drive socket (the plastic circle surrounding the metal coupling where the container meets the base). The drive socket should be well-attached, but able to spin freely. If the drive socket is cracked, solidly attached and unable to move, or easily removed, contact Customer Service to request parts or service. The high-pitched sound may be indicating that the blade bearing assembly is starting to break down. We suggest you contact Customer Service to troubleshoot the problem you are experiencing. The grinding sound may indicate the blade bearing assembly is starting to break down. We suggest you contact Customer Service to troubleshoot this problem. This may indicate an overfilled bearing or that the blade bearing assembly seal is starting to break down. If the problem persists or if grease is found on the counter, contact Customer Service. The container will slightly move on the base when the machine is turned on. But if your motor base is wobbling on the countertop, there is an issue with your drive socket or the rubber feet on the bottom of the machine. Please contact Customer Service for further assistance. Due to inactivity, your session has timed out and is no longer active. Reload the page
